

## NEW YORK CITY HOMELESSNESS

### The Basic Facts

- In recent years, homelessness in New York City has reached **the highest levels since the Great Depression of the 1930s**. [1] [2]
- In November 2023, there were **92,824 homeless people**, including **33,365 homeless children**, sleeping each night in New York City's main municipal shelter system. A total of **23,945 single adults** slept in shelters each night in November 2023.
- In addition to the primary shelter system operated by the Department of Homeless Services (DHS), the City has implemented a patchwork of other systems to accommodate asylum seekers and new arrivals.
- As of the end of December 2023, the total number of people sheltered in these systems was **approximately 123,000**. [3]
- Families entering shelters predominantly come from a few clustered zip codes in the poorest neighborhoods in New York City. [4] However, homeless families and single adults **come from every community district in NYC prior to entering shelters**.
- The number of homeless New Yorkers sleeping each night in municipal shelters is now **76 percent higher** than it was 10 years ago. The number of homeless single adults is **106 percent higher** than it was 10 years ago.
- Research shows that the **primary cause of homelessness, particularly among families, is lack of affordable housing**. Surveys of homeless families have identified the following major immediate, triggering causes of homelessness: **eviction; doubled-up or severely overcrowded housing; domestic violence; job loss; and hazardous housing conditions**. [5] [6] [7]
- Research shows that, compared to homeless families, homeless single adults have **higher rates of serious mental illness, addiction disorders, and other severe health problems**. [8]
- Each night **thousands of unsheltered homeless people** sleep on New York City streets, in the subway system, and in other public spaces. There is no accurate measurement of New York City's unsheltered homeless population, and recent **City surveys significantly underestimate the number of unsheltered homeless New Yorkers**.
- Studies show that the **large majority of unsheltered homeless New Yorkers are people living with mental illness or other severe health problems**. [9] [10]
- **Black and Hispanic/Latinx New Yorkers are disproportionately affected by homelessness**. Approximately 56 percent of heads of household in shelters are Black, 32 percent are Hispanic/Latinx, 7 percent are White, less than 1 percent are Asian-American or Native American, and 4 percent are of unknown race/ethnicity.
- In City Fiscal Year 2023, the **average length of stay** in the DHS shelter system was 412 days for single adults, 437 days for families with children, and 750 days for adult families. [11]
- In November 2019, DHS estimated that 77 percent of adult families, 68 percent of single adults, and 53 percent of families with children sleeping in shelters **had at least one disability**. [12]
