The Coalition for the Homeless provides up-to-date information on homelessness in NYC. There are now more people homeless in New York City than at any time since the Great Depression. You can find more information about homelessness at the following page: Facts About Homelessness.

Also see: How many people are homeless in NYC altogether?

**The Basic Facts:**

- In recent years, homelessness in New York City has reached the highest level since the Great Depression of the 1930s.

- In March 2024, 146,547 people slept each night in NYC shelters. Thousands more (there is no reliable number, as the annual HOPE estimate is deeply flawed) slept unsheltered in public spaces, and more than 200,000 people slept temporarily doubled-up in the homes of others. Thus, it can be estimated that more than 350,000 people were without homes in NYC in March 2024.

- In March 2024, 69 percent of those in shelters were members of homeless families, including 48,304 children. That month, 46,065 single adults slept in shelters. Forty-four percent of those in shelters, or 64,453 individuals, were New Arrivals.*

- 119,320 NYC schoolchildren experienced homelessness at some point during the 2022–2023 school year, representing more than 11% of all NYC public schoolkids.

- The primary reason people in NYC become homeless is the lack of affordable housing. Surveys of homeless families have identified the following major immediate, triggering causes of homelessness in NYC: eviction; doubled-up or severely overcrowded housing; domestic violence; job loss; and hazardous housing conditions.

- Between 1996 and 2017, NYC lost 1.1 million units of affordable housing. The most recent Housing Vacancy Survey indicates a vacancy rate of less than one percent for affordable apartments in NYC.

- Families entering shelters (excluding New Arrivals) predominantly come from a few clustered zip codes in the poorest neighborhoods in NYC. However, every community district in NYC contributes to the ongoing homelessness crisis.

- Compared to homeless families, homeless single adults have higher rates of serious mental illness, substance use disorders, and other severe health problems. There is not yet reliable data on such rates among asylum seekers and other new arrivals in the shelter system.
• Of the longer-term New Yorkers (non-New Arrivals) sleeping in the DHS shelters, 43 percent of families with children, 65 percent of single adults, and 75 percent of families without minor children have a disability requiring a facility-related accommodation.

• The majority of unsheltered homeless individuals are people living with a mental illness or other severe health problems.

• Black and Hispanic/Latinx New Yorkers are disproportionately affected by homelessness. Approximately 56 percent of heads of household in shelters are Black, 32 percent are Hispanic/Latinx, 7 percent are White, less than 1 percent are Asian-American or Native American, and 4 percent are of unknown race/ethnicity. Demographic info on New Arrivals in shelters has not been provided by the City, but the population is largely Black and Hispanic/Latinx.

• In City Fiscal Year 2023, the average length of stay in the DHS shelter system was 412 days for single adults, 437 days for families with children, and 750 days for adult families.

• New York’s legal Right to Shelter has given more than one million homeless New Yorkers a way off the streets since 1981.
